

# SQL: Basic Queries

Database Systems

Department of Computer Science, CBN  
Prof. Nasridinov Aziz ([aziz@chungbuk.ac.kr](mailto:aziz@chungbuk.ac.kr))

# **Table of Contents**

1. SQL Overview
2. Data Definition Language
3. Data Manipulation Language
4. Summary and Discussions

# Last Lecture

## ❖ Relational Model

- Relational model represents the database as a collection of relations
  - Relation = table
- Basic Terminologies
  - Relation
  - Tuple
  - Attribute
  - Degree
  - Cardinality
  - Domain
  - Relation Schema
  - Relation Instance
  - Relational Database Schema
  - NULL value

# Last Lecture

- ❖ Characteristics of relational model
- ❖ Keys
  - Super key, Candidate key, Primary key, Alternate key, Foreign key
- ❖ Integrity constraints  $\equiv$  rule
  - A set of rules used to ensure the accuracy and consistency of the relational database
  - Types of integrity constraints
    - Key constraint
    - Domain constraint
    - Referential integrity constraint

# 1. SQL Overview

- ❖ Structural Query Language (SQL) 
  - Define queries to access and manipulate the data from database
  - A procedural language, not a programming language
  - A standard language for RDBMS
    - Oracle, MySQL, Microsoft SQL and others
  - SQL statements are divided into four major categories
    - **Data Definition Language (DDL)**
    - **Data Manipulation Language (DML)**
    - Data Control Language (DCL)
    - Transaction Control Language (TCL)

# 1. SQL Overview

## ❖ SQL basic syntax

- SQL keywords are NOT case sensitive      대소문자 구분 X
  - select is the same as SELECT
- Comments      주석
  - Single line comments: -- (Put the space after --) or #
  - Multi-line comments: text between /\* and \*/
- Use semicolon (;) to separate each SQL statement in a database
- List of reserved SQL keywords
  - [https://www.w3schools.com/sql/sql\\_ref\\_keywords.asp](https://www.w3schools.com/sql/sql_ref_keywords.asp)

## 2. Data Definition Language

- ❖ Data Definition Language (DDL)

- Notation for defining the database schema
  - Used to create and modify the structure of your relations and database objects
- Statements
  - CREATE
  - DROP
  - ALTER
  - TRUNCATE

## 2. Data Definition Language

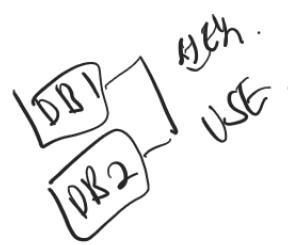

- ❖ Create database
  - Syntax
    - **CREATE DATABASE** *databasename*;
  - Example
    - **CREATE DATABASE** testDB;
  - You can check a list of databases using the following SQL statement
    - **SHOW DATABASES**;

## 2. Data Definition Language

- ❖ Drop an existing database

- Syntax
    - **DROP DATABASE** *databasename*;
  - Example
    - **DROP DATABASE** testDB;

- ❖ Set as default schema

- Syntax 
    - **USE** *databasename*;
  - Example
    - **USE** testDB;

## 2. Data Definition Language

### ❖ Create relation

- Syntax

**CREATE TABLE** *relation\_name*(

*attribute1*           *datatype*,

*attribute2*           *datatype*,

*attribute3*           *datatype*,

    ...

    ...

);

*Domain*

=

A <sub>1</sub>	A <sub>2</sub>	A <sub>3</sub>
E1		
O1	"	
E2		"
O2		"

- Full list of MySQL Data Types

- [https://www.w3schools.com/MySQL/mysql\\_datatypes.asp](https://www.w3schools.com/MySQL/mysql_datatypes.asp)

## 2. Data Definition Language

- ❖ Create relation

- Example

```
CREATE TABLE department(  
    deptno      int, + NN  
    deptname    varchar(45),  
    floor       int  
);
```

PK ~~설정~~ !!  
= default

- The empty DEPARTMENT relation will now look like this:

DEPARTMENT	DEPTNO	DEPTNAME	FLOOR

## 2. Data Definition Language

### ❖ Drop an existing relation in a database

- Syntax
  - **DROP TABLE** *relation\_name*;
- Example
  - **DROP TABLE** department;

테이블 삭제

### ❖ Delete the data inside a relation, but not the relation itself

- Syntax
  - **TRUNCATE TABLE** *relation\_name*;
- Example
  - **TRUNCATE TABLE** department;

데이터만 삭제

테이블은 남김

## 2. Data Definition Language

- ❖ Alter relation – Add attribute

- Syntax

**ALTER TABLE** *relation\_name*

**ADD** *attribute\_name datatype;*

- Example

**ALTER TABLE** department

**ADD** phonenumber varchar(45);

## 2. Data Definition Language

- ❖ Alter relation – Drop attribute

- Syntax

**ALTER TABLE** *relation\_name*

**DROP COLUMN** *attribute\_name*;

- Example

**ALTER TABLE** department

**DROP COLUMN** phonenumber;

## 2. Data Definition Language

- ❖ Alter relation – Change attribute name

- Syntax

**ALTER TABLE** *relation\_name*

**CHANGE** *old\_attribute\_name new\_attribute\_name datatype;*

- Example

**ALTER TABLE** department

**CHANGE** deptname departmentname varchar(45);

## 2. Data Definition Language

- ❖ Alter relation – Modify attribute

- Syntax

**ALTER TABLE** *relation\_name*

**MODIFY COLUMN** *attribute\_name datatype;*

- Example

**ALTER TABLE** department

**MODIFY COLUMN** floor varchar(45);

## 2. Data Definition Language

### ❖ MySQL constraints

- SQL constraints are used to specify rules for the data in a relation
- MySQL constraints
  - **NOT NULL** → 모든 테이블이 존재해야 함. PK는 NULL이
  - **PRIMARY KEY** → 같은 테이블이 존재해야 함.
  - **FOREIGN KEY**
  - **UNIQUE**
  - **CHECK**
  - **DEFAULT**
  - **CREATE INDEX**

# 2. Data Definition Language

## ❖ MySQL Constraints in MySQL Workbench

The screenshot shows the MySQL Workbench interface for defining a table named 'employee' in the schema 'testdb'. The 'Columns' tab is selected, displaying the following table structure:

Column Name	Datatype	PK	NN	UQ	B	UN	ZF	AI	G	Default/Expression
empno	INT	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>						
empname	VARCHAR(45)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	NULL
title	VARCHAR(45)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	'사원'
manager	INT	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	NULL
salary	INT	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	NULL
dno	INT	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	NULL

Below the table definition, there are fields for adding new columns, and at the bottom, tabs for Indexes, Foreign Keys, Triggers, Partitioning, Options, and buttons for Apply and Revert.

# 2. Data Definition Language

## ❖ MySQL constraints

- Constraints can be specified when the relation is created with the CREATE TABLE statement
- You can also specify constraints after the relation is created with the ALTER TABLE statement
- Syntax

```
CREATE TABLE relation_name(  
    attribute1      datatype      constraint,  
    attribute2      datatype      constraint,  
    attribute3      datatype      constraint,  
    ...              ...  
);
```

## 2. Data Definition Language

### ❖ NOT NULL constraint

- By default, an attribute can hold NULL values
  - The NOT NULL constraint enforces an attribute to NOT accept NULL values
- Example

```
CREATE TABLE department(  
    deptno          int      NOT NULL,  
    deptname        varchar(45) NOT NULL,  
    floor           int  
);
```

- Example
- ```
ALTER TABLE department  
MODIFY floor int NOT NULL;
```

## 2. Data Definition Language

- ❖ PRIMARY KEY constraint
    - The PRIMARY KEY constraint uniquely identifies each tuple in a relation
    - Primary keys must contain unique values, and cannot contain NULL values
    - Example
- CREATE TABLE** department(
- |          |             |           |
|----------|-------------|-----------|
| deptno   | int         | NOT NULL, |
| deptname | varchar(45) | NOT NULL, |
| floor    | int,        |           |
- CONSTRAINT PK\_Department PRIMARY KEY (deptno)**
- );

## 2. Data Definition Language

### ❖ PRIMARY KEY constraint

- You can also drop PRIMARY KEY constraint

**ALTER TABLE** department

**DROP PRIMARY KEY;**

- To create a PRIMARY KEY constraint on the “deptno” attribute when the relation is already created

**ALTER TABLE** department

**ADD CONSTRAINT** PK\_Department **PRIMARY KEY** (deptno);

## 2. Data Definition Language

- ❖ FOREIGN KEY constraint
  - Used to create a relationship between two relations
  - Types of foreign key
    - Foreign key referencing the primary key of another relation
    - Foreign key referencing the primary key of its own relation
    - Foreign key that is a composite of the primary keys
  - The relation with the foreign key is called the **referencing relation** (or child relation), and the relation with the primary key is called the **referenced relation** (or parent relation)

## 2. Data Definition Language

### ❖ FOREIGN KEY constraint

- Referencing relation: EMPLOYEE; Referenced relation : DEPARTMENT

Referencing

| EMPLOYEE | EMPNO | EMPNAME | TITLE | MANAGER | SALARY  | DNO |
|----------|-------|---------|-------|---------|---------|-----|
|          | 2106  | 김창섭     | 대리    | 1003    | 2500000 | 2   |
|          | 3426  | 박영권     | 과장    | 4377    | 3000000 | 1   |
|          | 3011  | 이수민     | 부장    | 4377    | 4000000 | 3   |
|          | 1003  | 조민희     | 과장    | 4377    | 3000000 | 2   |
|          | 3427  | 최종철     | 사원    | 3011    | 1500000 | 3   |
|          | 1365  | 김상원     | 사원    | 3426    | 1500000 | 1   |
|          | 4377  | 이성래     | 사장    | ^       | 5000000 | 2   |

Referencing

| DEPARTMENT | DEPTNO | DEPTNAME | FLOOR |
|------------|--------|----------|-------|
|            | 1      | 영업       | 8     |
|            | 2      | 기획       | 10    |
|            | 3      | 개발       | 9     |
|            | 4      | 총무       | 7     |

# 2. Data Definition Language

## ❖ FOREIGN KEY constraint

- Syntax

**CONSTRAINT *FK\_name***

**FOREIGN KEY (*FK\_attribute*) REFERENCES *parent\_relation(PK\_attribute)***

- Example

**CREATE TABLE** employee(

|         |              |           |
|---------|--------------|-----------|
| empno   | int          | NOT NULL, |
| empname | varchar(45), |           |
| title   | varchar(45), |           |
| manager | int,         |           |
| salary  | int,         |           |
| dno     | int,         |           |

**CONSTRAINT PK\_Employee PRIMARY KEY (empno),**

**CONSTRAINT FK\_Employee\_Manager**

**FOREIGN KEY (manager) REFERENCES employee(empno),**

**CONSTRAINT FK\_Department\_Employee**

**FOREIGN KEY (dno) REFERENCES department(deptno)**

);

FOREIGN KEY name

## 2. Data Definition Language

### ❖ FOREIGN KEY constraint

- To drop FOREIGN KEY constraint

**ALTER TABLE** employee

**DROP FOREIGN KEY** FK\_Department\_Employee;

FOREIGN KEY  
= IL FOREIGN KEY  
자주하는 것 .

- To add FOREIGN KEY constraint

**ALTER TABLE** employee

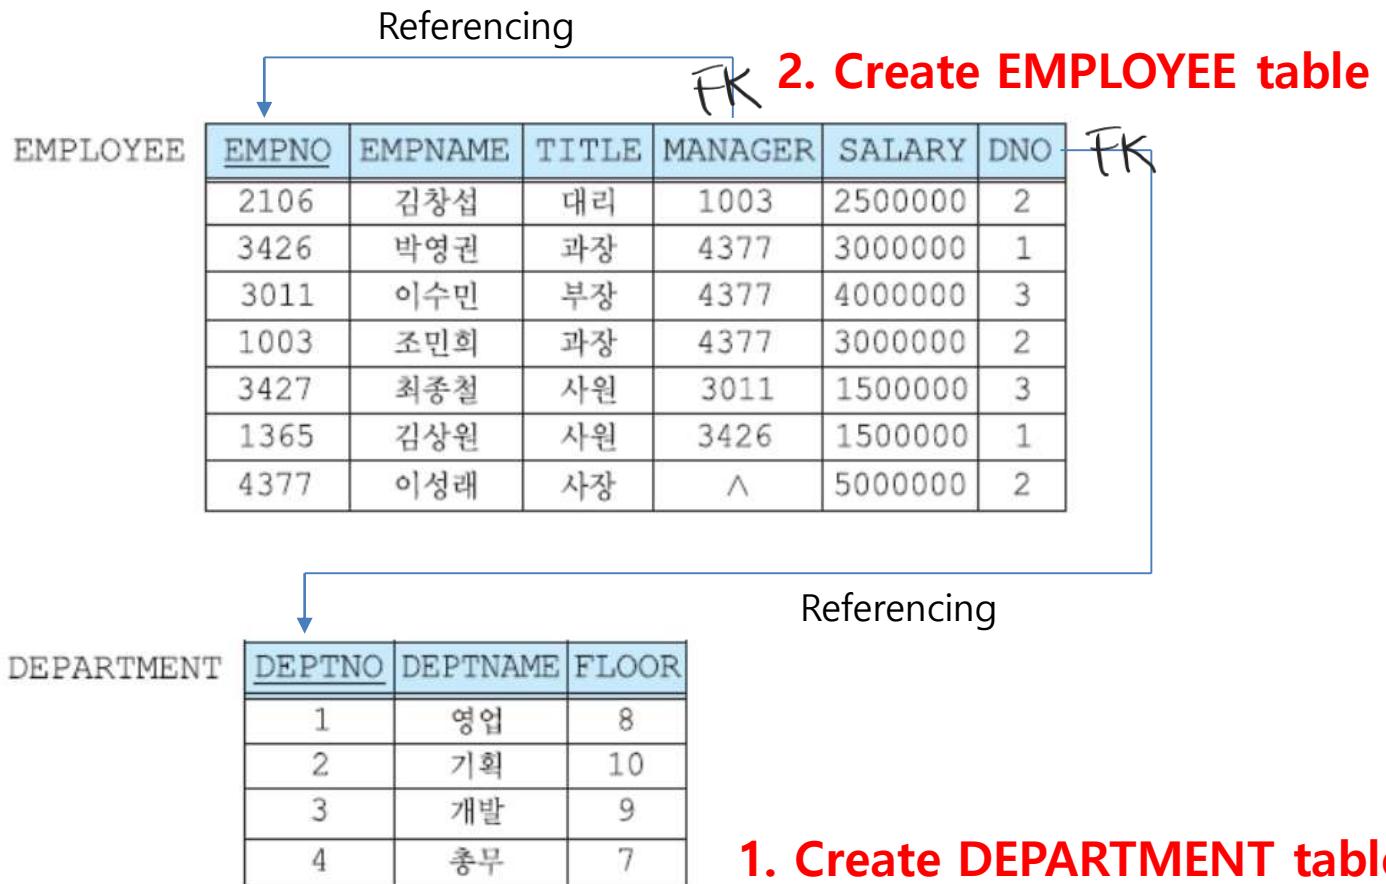

**ADD CONSTRAINT** FK\_Department\_Employee

**FOREIGN KEY** (dno) **REFERENCES** department(deptno);

## 2. Data Definition Language

### ❖ Summary

- Referencing relation: EMPLOYEE; Referenced relation : DEPARTMENT

## 2. Data Definition Language

### ❖ Summary

- First create DEPARTMENT table with PRIMARY KEY constraint
- DEPARTMENT Table

**CREATE TABLE** department(

deptno                  int                     NOT NULL,

deptname               varchar(45)        NOT NULL,

floor                   int,

**CONSTRAINT** PK\_Department **PRIMARY KEY** (deptno)

);

## 2. Data Definition Language

### ❖ Summary

- Then create EMPLOYEE table with FOREIGN KEY constraint

```
CREATE TABLE employee(
```

|       |     |                  |
|-------|-----|------------------|
| empno | int | <b>NOT NULL,</b> |
|-------|-----|------------------|

|         |              |
|---------|--------------|
| empname | varchar(45), |
|---------|--------------|

|       |             |
|-------|-------------|
| title | varchar(45) |
|-------|-------------|

|         |      |
|---------|------|
| manager | int, |
|---------|------|

|        |      |
|--------|------|
| salary | int, |
|--------|------|

|     |      |
|-----|------|
| dno | int, |
|-----|------|

```
CONSTRAINT PK_Employee PRIMARY KEY (empno),
```

```
CONSTRAINT FK_Employee_Manager
```

```
FOREIGN KEY (manager) REFERENCES employee(empno),
```

```
CONSTRAINT FK_Department_Employee
```

```
FOREIGN KEY (dno) REFERENCES department(deptno)
```

```
);
```

# **3. Data Manipulation Language**

## ❖ Data Manipulation Language (DML)

- A language for searching, modifying, inserting and deleting the desired data in the database
  - DML also known as query language
- Statements
  - INSERT
  - UPDATE
  - DELETE
  - SELECT

# 3. Data Manipulation Language

## ❖ The **INSERT INTO** statement

- Used to insert tuples into the relation
- Specify both the attributes names and the values to be inserted

```
INSERT INTO relation_name (attribute1, attribute2, attribute3, ...)  
VALUES (value1, value2, value3, ...);
```

- If you are adding values for all the attributes of the relation, you do not need to specify the attribute names in the SQL query

```
INSERT INTO relation_name  
VALUES (value1, value2, value3, ...);
```

# 3. Data Manipulation Language

## ❖ The INSERT INTO statement

- Example of inserting a single tuple

```
INSERT INTO department (deptno, deptname, floor)
```

```
VALUES (1, '영업', 8);
```

- Example of inserting multiple tuples

```
INSERT INTO department
```

```
(deptno, deptname, floor)
```

```
VALUES
```

```
(2, '기획', 10),
```

```
(3, '개발', 9),
```

```
(4, '충무', 7);
```

# 3. Data Manipulation Language

## ❖ The INSERT INTO statement

- The INSERT INTO statement without attribute names

**INSERT INTO** employee

**VALUES**

```
(4377, '이성래', '사장', NULL, 5000000, 2),  
(3011, '이수민', '부장', 4377, 4000000, 3),  
(3426, '박영권', '과장', 4377, 3000000, 1),  
(1003, '조민희', '과장', 4377, 3000000, 2),  
(2106, '김창섭', '대리', 1003, 2500000, 2),  
(3427, '최종철', '사원', 3011, 1500000, 3),  
(1365, '김상원', '사원', 3426, 1500000, 1);
```

# 3. Data Manipulation Language

## ❖ The UPDATE statement

- Used to modify the existing tuples in a relation

**UPDATE** *relation\_name*

**SET** *attribute1 = value1, attribute2 = value2, ...*

**WHERE** *condition;*

(optional)

PK의 조건  
(ex: empno = ?)

| name |    |    |
|------|----|----|
| A1   | A2 | A3 |
| ○    | ○  | ○  |
| ○    | ○  | ○  |
| ○    | ○  | ○  |

- Example: Suppose that a person with an employee number 1365 received the promotion from '사원' to '대리' and his salary is increased from 1500000 to 2500000. Use UPDATE statement to make this change:

**UPDATE** *employee*

**SET** *title = '대리', salary = 2500000*

**WHERE** *empno = 1365;*

# 3. Data Manipulation Language

## ❖ The DELETE statement

- Used to delete existing tuples in a relation

**DELETE FROM** *relation\_name* **WHERE** *condition*;

- Example: Suppose that a person with an employee number 2106 quit the job. Use DELETE statement to remove the tuple related to 2106

**DELETE FROM** *employee* **WHERE** *empno = 2106*;

# 3. Data Manipulation Language

## ❖ The SELECT statement

- Used to select/retrieve tuples from a database

- Syntax

**SELECT**

[**DISTINCT**] attribute(s)

(1)

**FROM**

relation(s)

(2)

**[WHERE]**

condition]

(3)

**[GROUP BY]**

attribute(s)]

(4)

**[HAVING]**

condition]

(5)

**[ORDER BY]**

attribute(s)]

(6)

**[LIMIT]**

number];

(7)

*\* order of statement*

Compulsory

Optional

# 3. Data Manipulation Language

## ❖ The SELECT statement

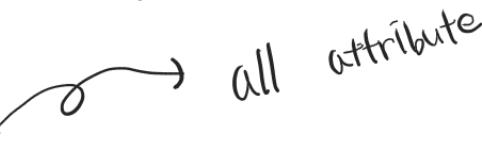

- Example: Select all attributes of department relation

**SELECT** deptno, deptname, floor

**FROM** department;

**SELECT \***

**FROM** department;

| DEPTNO | DEPTNAME | FLOOR |
|--------|----------|-------|
| 1      | 영업       | 8     |
| 2      | 기획       | 10    |
| 3      | 개발       | 9     |
| 4      | 총무       | 7     |

# 3. Data Manipulation Language

- ❖ The INSERT INTO SELECT statement
  - Copies data from one table and inserts it into another table
  - Example
    - **INSERT INTO** Customers (CustomerName, City, Country)
    - **SELECT** SupplierName, City, Country FROM Suppliers;
- ❖ The SELECT INTO statement
  - Copies data from one table and inserts it into a new table
  - Example
    - **SELECT \* INTO** CustomersBackup2017
    - **FROM** Customers;

# 3. Data Manipulation Language

## ❖ The SELECT statement

- Example: Search the titles of all employees

```
SELECT title
```

```
FROM employee;
```

| TITLE |
|-------|
| 대리    |
| 과장    |
| 부장    |
| 과장    |
| 사원    |
| 사원    |
| 사장    |

# 3. Data Manipulation Language

## ❖ The SELECT statement

- Example: Search only distinct titles of all employees

**SELECT DISTINCT title**  
**FROM employee;**

*remove  
duplicates*

| TITLE |
|-------|
| 대리    |
| 과장    |
| 부장    |
| 사원    |
| 사장    |

# 3. Data Manipulation Language

## ❖ The SELECT statement

- Example: Retrieve all information about employees in department 2

```
SELECT *
```

```
FROM employee
```

```
WHERE DNO = 2;
```

| EMPNO | EMPNAME | TITLE | MANAGER | SALARY  | DNO |
|-------|---------|-------|---------|---------|-----|
| 1003  | 조민희     | 과장    | 4377    | 3000000 | 2   |
| 2016  | 김창섭     | 대리    | 1003    | 2500000 | 2   |
| 4377  | 이성래     | 사장    | NULL    | 5000000 | 2   |

# 3. Data Manipulation Language

- ❖ The SELECT statement – AND operator
  - The AND operator displays a tuple if all the conditions separated by AND are TRUE
  - Example: Search for the names and salaries of employees with a manager position and working in department 1

**SELECT** empname, salary

**FROM** employee

**WHERE** title = '과장' **AND** dno = 1;

| EMPNAME | SALARY  |
|---------|---------|
| 박영권     | 3000000 |

# 3. Data Manipulation Language

- ❖ The SELECT statement – AND operator
  - Example: Search for the names and salaries of employees whose job title is a manager and do not belong to department 1

**SELECT** empname, salary

**FROM** employee

**WHERE** title = '과장' **AND** dno  $\neq$  1;

$\neq$

| EMPNAME | SALARY  |
|---------|---------|
| 조민희     | 3000000 |

- Note that in some versions of SQL,  $\neq$  operator may be written as  
 $\neq$

# 3. Data Manipulation Language

## ❖ The SELECT statement – AND operator

- Example: Search for the names, positions, and salaries of employees with a salary of 3,000,000 won or more and less than 4,500,000 won

```
SELECT empname, title, salary  
FROM employee  
WHERE salary BETWEEN 3000000 AND 4500000;
```

```
SELECT empname, title, salary  
FROM employee  
WHERE salary >= 3000000 AND salary <= 4500000;
```

| EMPNAME | TITLE | SALARY  |
|---------|-------|---------|
| 박영권     | 과장    | 3000000 |
| 이수민     | 부장    | 4000000 |
| 조민희     | 과장    | 3000000 |

# 3. Data Manipulation Language

- ❖ The SELECT statement – OR operator
  - The OR operator displays a tuple if any of the conditions separated by OR is TRUE
  - Example: Search for employees who have title '대리' or '사원'

**SELECT \***

**FROM** employee

**WHERE** title = '대리' **OR** title = '사원';

| <u>EMPNO</u> | EMPNAME | TITLE | MANAGER | SALARY  | DNO |
|--------------|---------|-------|---------|---------|-----|
| 2106         | 김창섭     | 대리    | 1003    | 2500000 | 2   |
| 3427         | 최종철     | 사원    | 3011    | 1500000 | 3   |
| 1365         | 김상원     | 사원    | 3426    | 1500000 | 1   |

# 3. Data Manipulation Language

- ❖ The SELECT statement – NOT operator
  - The NOT operator displays a tuple if the condition(s) is NOT TRUE
  - Example: Search all information related to employees except the owner

**SELECT \***

**FROM employee**

**WHERE NOT title = '사장';**

| <u>EMPNO</u> | EMPNAME | TITLE | MANAGER | SALARY  | DNO |
|--------------|---------|-------|---------|---------|-----|
| 2106         | 김창섭     | 대리    | 1003    | 2500000 | 2   |
| 3426         | 박영권     | 과장    | 4377    | 3000000 | 1   |
| 3011         | 이수민     | 부장    | 4377    | 4000000 | 3   |
| 1003         | 조민희     | 과장    | 4377    | 3000000 | 2   |
| 3427         | 최종철     | 사원    | 3011    | 1500000 | 3   |
| 1365         | 김상원     | 사원    | 3426    | 1500000 | 1   |

### 3. Data Manipulation Language

#### ❖ The SELECT statement – LIKE operator

← Exam Alert

- Example: Search for the names, titles, and department numbers of employees with the Lee surname

**SELECT** empname, title, dno

**FROM** employee

**WHERE** empname **LIKE** '0|%';

| EMPNAME | TITLE | DNO |
|---------|-------|-----|
| 이수민     | 부장    | 3   |
| 이성래     | 사장    | 2   |

# 3. Data Manipulation Language

- ❖ The SELECT statement – LIKE operator
  - Other cases of LIKE operator with '%' and '\_' keywords

| LIKE Operator                   | Description                                                                  |
|---------------------------------|------------------------------------------------------------------------------|
| WHERE CustomerName LIKE 'a%'    | Finds any values that start with "a"                                         |
| WHERE CustomerName LIKE '%a'    | Finds any values that end with "a"                                           |
| WHERE CustomerName LIKE '%or%'  | Finds any values that have "or" in any position                              |
| WHERE CustomerName LIKE '_r%'   | Finds any values that have "r" in the second position                        |
| WHERE CustomerName LIKE 'a_ %'  | Finds any values that start with "a" and are at least 2 characters in length |
| WHERE CustomerName LIKE 'a__ %' | Finds any values that start with "a" and are at least 3 characters in length |
| WHERE ContactName LIKE 'a%oo'   | Finds any values that start with "a" and ends with "o"                       |

%  
/\_

### 3. Data Manipulation Language

#### ❖ The SELECT statement – IN operator

- Example: Retrieve all information about employees belonging to department 1 or department 3

**SELECT \***

**FROM employee**

**WHERE dno IN (1, 3);**

→ 이거 'or' 넣으면  
해결되지 말 것!!

| EMPNO | EMPNAME | TITLE | MANAGER | SALARY  | DNO |
|-------|---------|-------|---------|---------|-----|
| 1365  | 김상원     | 사원    | 3426    | 1500000 | 1   |
| 3011  | 이수민     | 부장    | 4377    | 4000000 | 3   |
| 3426  | 박영권     | 과장    | 4377    | 3000000 | 1   |
| 3427  | 최종철     | 사원    | 3011    | 1500000 | 3   |

# 3. Data Manipulation Language

- ❖ The SELECT statement – Arithmetic Operators
  - Example: Retrieve the names, current salaries, and salaries increased by 10% for employees with a manager position

```
SELECT empname, salary, salary * 1.1 AS newsalary  
FROM employee  
WHERE title = '과장';
```

별칭

| EMPNAME | SALARY  | NEWSALARY |
|---------|---------|-----------|
| 박영권     | 3000000 | 3300000   |
| 조민희     | 3000000 | 3300000   |

# 3. Data Manipulation Language

- ❖ The SELECT statement – Aggregation Functions
  - Applied to one attribute of a relation and returns a single value
  - **Can only appear in SELECT and HAVING clauses**
  - Aggregation functions
    - COUNT – counts the number of tuples or values
    - SUM – sums the values
    - AVG – returns the average of values
    - MAX – returns maximum value
    - MIN – returns min value

# 3. Data Manipulation Language

- ❖ The SELECT statement – Aggregation Functions

- Example: Show the maximum and average salary of all employees

```
SELECT AVG(salary) AS avgSalary, MAX(salary) AS maxSalary  
FROM employee;
```

| AVGSAL  | MAXSAL  |
|---------|---------|
| 2928571 | 5000000 |

- Example: Count all tuples in employee relation

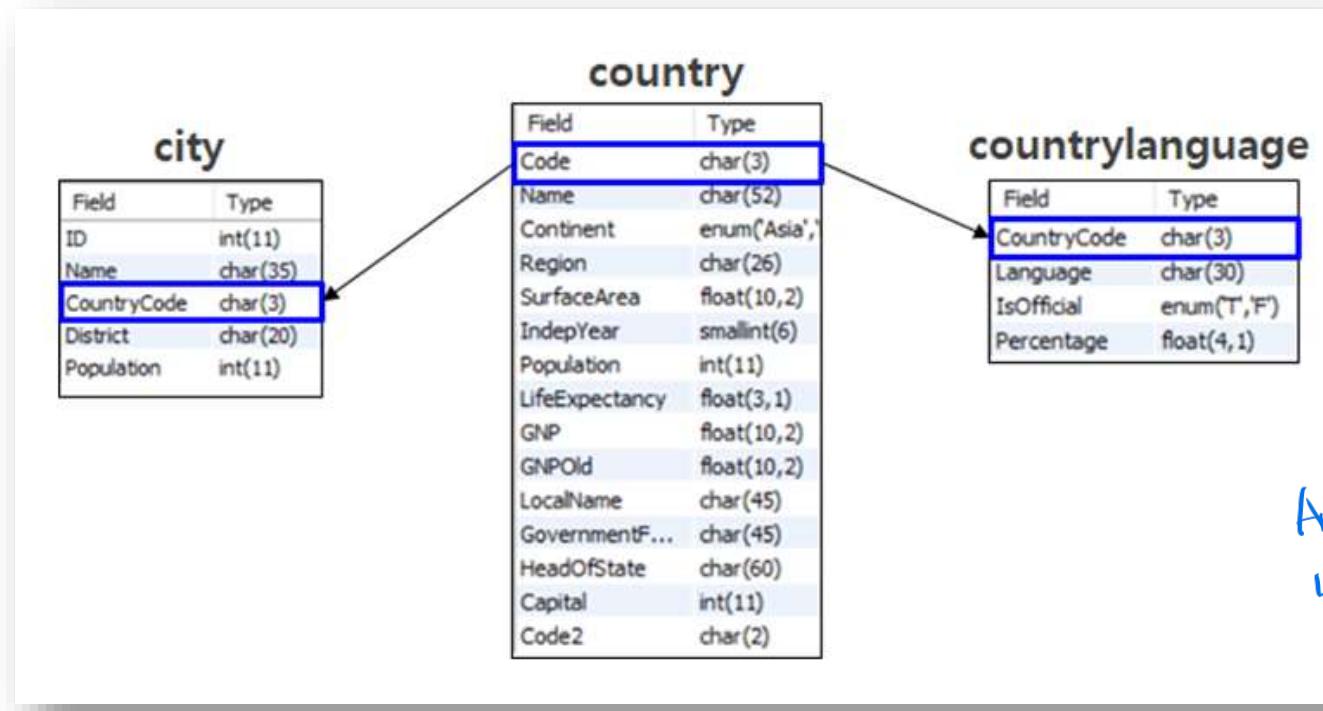

```
SELECT COUNT(*) AS allTuples  
FROM employee;
```

|           |
|-----------|
| allTuples |
| 7         |

# 3. Data Manipulation Language

## ❖ Quiz 1

- Given the following WORLD database

- Find how many languages are spoken in the USA

AS ~  
나는 알고 싶어.  
SELECT count(\*)  
FROM countrylanguage  
WHERE CountryCode = 'USA';

# 3. Data Manipulation Language

- ❖ More about data

|   | CountryCode | Language   | IsOfficial | Percentage |
|---|-------------|------------|------------|------------|
| ▶ | ABW         | Dutch      | T          | 5.3        |
|   | ABW         | English    | F          | 9.5        |
|   | ABW         | Papiamento | F          | 76.7       |
|   | ABW         | Spanish    | F          | 7.4        |
|   | AFG         | Balochi    | F          | 0.9        |
|   | AFG         | Dari       | T          | 32.1       |
|   | AFG         | Pashto     | T          | 52.4       |
|   | AFG         | Turkmenian | F          | 1.9        |
|   | AFG         | Uzbek      | F          | 8.8        |

### 3. Data Manipulation Language

- ❖ Answer to Query 1

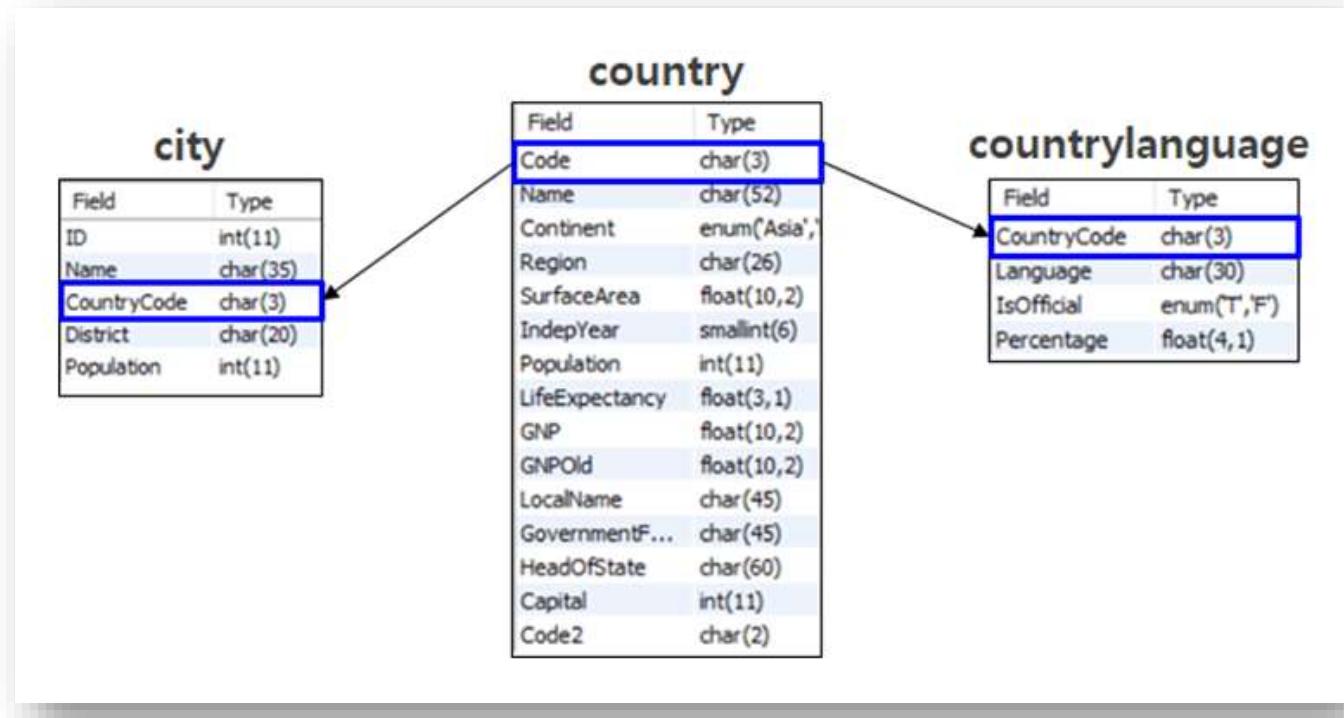

```
SELECT COUNT(*) AS LanguagesInUSA  
FROM CountryLanguage  
WHERE CountryCode = 'USA';
```

|   | LanguagesInUSA |
|---|----------------|
| ▶ | 12             |

# 3. Data Manipulation Language

## ❖ Quiz 2

- Given the following WORLD database

- Find total amount of languages in the world

### 3. Data Manipulation Language

- ❖ Answer to Query 2: Count how many languages are in the world

```
SELECT COUNT(Language)  
FROM CountryLanguage ;
```

|   | COUNT(Language) |
|---|-----------------|
| ▶ | 984             |

- ❖ Answer to Query 2: Count how many languages are in the world

```
SELECT COUNT( DISTINCT Language)  
FROM CountryLanguage;
```

|   | COUNT(DISTINCT Language) |
|---|--------------------------|
| ▶ | 457                      |

# 3. Data Manipulation Language

## ❖ Query 2 Explanation

- There are many duplicated records in Language attribute

**Duplicated Records**

|  | CountryCode | Language | IsOfficial | Percentage |
|--|-------------|----------|------------|------------|
|  | COL         | Arawakan | F          | 0.1        |
|  | GUY         | Arawakan | F          | 1.4        |
|  | ARM         | Armenian | T          | 93.4       |
|  | AZE         | Armenian | F          | 2.0        |
|  | GEO         | Armenian | F          | 6.8        |
|  | JOR         | Armenian | F          | 1.0        |
|  | LBN         | Armenian | F          | 5.9        |
|  | BTN         | Asami    | F          | 15.2       |
|  | IND         | Asami    | F          | 1.5        |

# 3. Data Manipulation Language

## ❖ The SELECT statement

- Used to select/retrieve tuples from a database

- Syntax

|                  |                                  |     |            |
|------------------|----------------------------------|-----|------------|
| <b>SELECT</b>    | [ <b>DISTINCT</b> ] attribute(s) | (1) | Compulsory |
| <b>FROM</b>      | relation(s)                      | (2) |            |
| <b>[WHERE</b>    | condition]                       | (3) |            |
| <b>[GROUP BY</b> | attribute(s)]                    | (4) | Optional   |
| <b>[HAVING</b>   | condition]                       | (5) |            |
| <b>[ORDER BY</b> | attribute(s)]                    | (6) |            |
| <b>[LIMIT</b>    | number];                         | (7) |            |

# 3. Data Manipulation Language

## ❖ The GROUP BY statement

- Used to group tuples with the same value in the attribute
  - **In the result, one tuple is created for each group**
- We often use GROUP BY with aggregation functions (COUNT, SUM, AVG, MAX, MIN)
- Example: Group employees by department number, and show the department number, average salary, and maximum salary in each department

**SELECT** dno, **AVG**(salary) as avgsal, **MAX**(salary) as maxsal  
**FROM** employee  
**GROUP BY** dno;

Grouping

# 3. Data Manipulation Language

- The GROUP BY statement

| EMPLOYEE | EMPNO | EMPNAME | TITLE | MANAGER | SALARY  | DNO |
|----------|-------|---------|-------|---------|---------|-----|
|          | 3426  | 박영권     | 과장    | 4377    | 3000000 | 1   |
|          | 1365  | 김상원     | 사원    | 3426    | 1500000 | 1   |
|          | 2106  | 김창섭     | 대리    | 1003    | 2500000 | 2   |
|          | 1003  | 조민희     | 과장    | 4377    | 3000000 | 2   |
|          | 4377  | 이성래     | 사장    | ^       | 5000000 | 2   |
|          | 3011  | 이수민     | 부장    | 4377    | 4000000 | 3   |
|          | 3427  | 최종철     | 사원    | 3011    | 1500000 | 3   |

Grouped

→

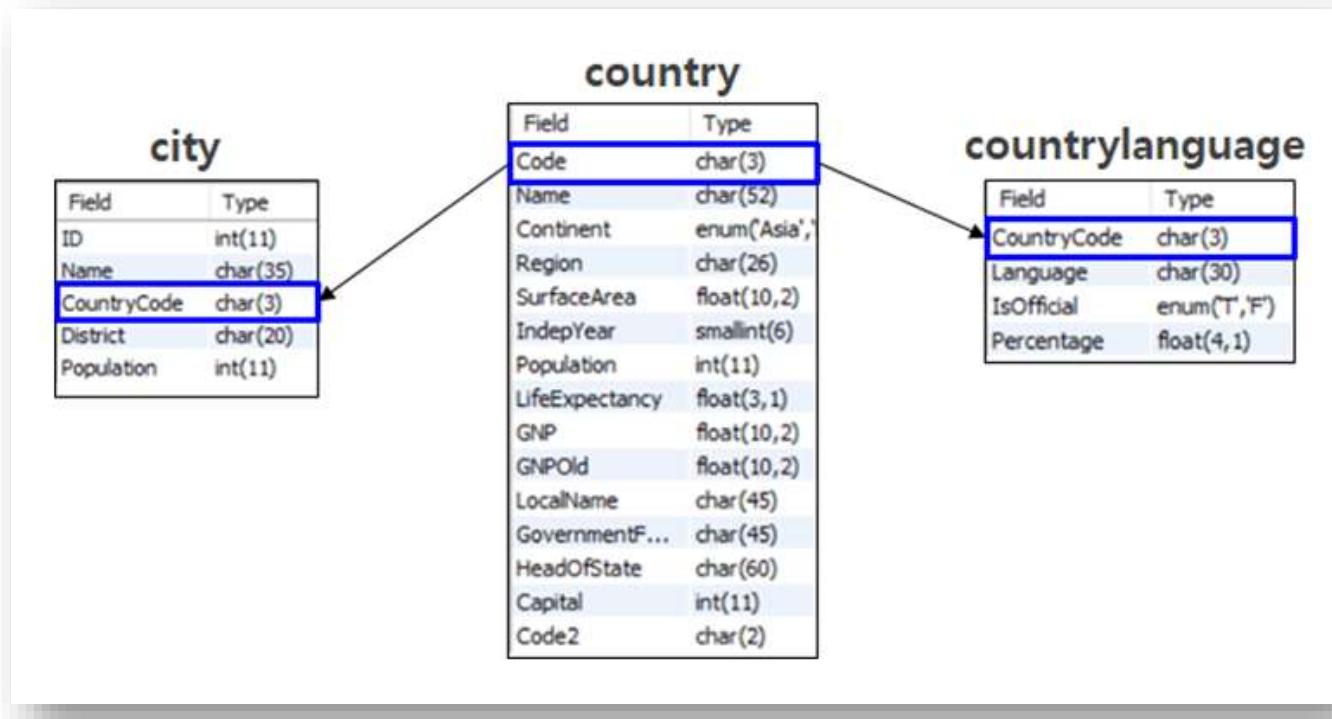

| DNO | AVGSAL  | MAXSAL  |
|-----|---------|---------|
| 1   | 2250000 | 3000000 |
| 2   | 3500000 | 5000000 |
| 3   | 2750000 | 4000000 |

) 3 tuples

# 3. Data Manipulation Language

## ❖ Quiz 3

- Given the following WORLD database

- How many countries speak each language

# 3. Data Manipulation Language

- ❖ Answer to Query 3: How many countries speak each language
  - **SELECT** Language, **COUNT**(CountryCode)
  - **FROM** CountryLanguage
  - **GROUP BY** Language

|   | Language   | COUNT(CountryCode) |
|---|------------|--------------------|
| ▶ | Dutch      | 5                  |
|   | English    | 60                 |
|   | Papiamento | 2                  |
|   | Spanish    | 28                 |
|   | Balochi    | 4                  |
|   | Dari       | 1                  |
|   | Pashto     | 2                  |
|   | Turkmenian | 3                  |
|   | Uzbek      | 6                  |

# 3. Data Manipulation Language

## ❖ Quiz 3 Explanation

- Group by Language attribute: Arawakan, Armenian, Asami, etc

|  | CountryCode | Language | IsOfficial | Percentage |
|--|-------------|----------|------------|------------|
|  | COL         | Arawakan | F          | 0.1        |
|  | GUY         | Arawakan | F          | 1.4        |
|  | ARM         | Armenian | T          | 93.4       |
|  | AZE         | Armenian | F          | 2.0        |
|  | GEO         | Armenian | F          | 6.8        |
|  | JOR         | Armenian | F          | 1.0        |
|  | LBN         | Armenian | F          | 5.9        |
|  | BTN         | Asami    | F          | 15.2       |
|  | IND         | Asami    | F          | 1.5        |

# 3. Data Manipulation Language

+ GROUP BY

## ❖ The HAVING statement

- Used to create a condition on a group of tuples
- Attributes appearing in the HAVING statement must appear in the GROUP BY clause or be included in a aggregate function
- Example: Group employees by department number, and show the department number, average salary, and maximum salary for the department with the average salary of 2,500,000 Korean Won.

|                 |                                                                   |
|-----------------|-------------------------------------------------------------------|
| <b>SELECT</b>   | dno, <b>AVG</b> (salary) as avgsal, <b>MAX</b> (salary) as maxsal |
| <b>FROM</b>     | employee                                                          |
| <b>GROUP BY</b> | dno                                                               |
| <b>HAVING</b>   | avgsal >= 2500000;                                                |

# 3. Data Manipulation Language

## ❖ The HAVING statement

| EMPLOYEE | EMPNO | EMPNAME | TITLE | MANAGER | SALARY  | DNO |
|----------|-------|---------|-------|---------|---------|-----|
|          | 3426  | 박영권     | 과장    | 4377    | 3000000 | 1   |
|          | 1365  | 김상원     | 사원    | 3426    | 1500000 | 1   |
|          | 2106  | 김창섭     | 대리    | 1003    | 2500000 | 2   |
|          | 1003  | 조민희     | 과장    | 4377    | 3000000 | 2   |
|          | 4377  | 이성래     | 사장    | ^       | 5000000 | 2   |
|          | 3011  | 이수민     | 부장    | 4377    | 4000000 | 3   |
|          | 3427  | 최종철     | 사원    | 3011    | 1500000 | 3   |

GROUP BY →

| DNO | AVGSAL  | MAXSAL  |
|-----|---------|---------|
| 1   | 2250000 | 3000000 |
| 2   | 3500000 | 5000000 |
| 3   | 2750000 | 4000000 |

HAVING →

| DNO | AVGSAL  | MAXSAL  |
|-----|---------|---------|
| 2   | 3500000 | 5000000 |
| 3   | 2750000 | 4000000 |

Grouped

그룹화

HAVING 조건 추가

# 3. Data Manipulation Language

## ❖ The ORDER BY statement

- By default, the tuples are presented to the user in the order inserted in the relation
- The ORDER BY statement is used to sort the resulting relation in ascending or descending order
- Types of ORDER BY statement
  - Default sort order is ascending (ASC)
  - Sort order can be specified in descending order by specifying DESC
- The null value appears first in ascending order and last in descending order

### 3. Data Manipulation Language

#### ❖ The ORDER BY statement

- Example: Search for the salary, title, and name of employees in department 2 and sort them in ascending order of salaries

**SELECT** salary, title, empname

**FROM** employee

**WHERE** dno = 2

**ORDER BY** salary;

오름차순 정렬

| SALARY  | TITLE | EMPNAME |
|---------|-------|---------|
| 2500000 | 대리    | 김창섭     |
| 3000000 | 과장    | 조민희     |
| 5000000 | 사장    | 이성래     |

# 3. Data Manipulation Language

## ❖ The LIMIT statement

- Used to specify the number of records to return  
*"top" tuple or record  
가 필요한 경우 유용하다*
- The LIMIT statement is useful on large tables with thousands of records
  - Returning a large number of records can impact performance
- Example: Show the first three records from the employee table
  - **SELECT \***
  - **FROM employee**
  - **LIMIT 3;**  
*tuple 개수 제한.*

| EMPNO | EMPNAME | TITLE | MANAGER | SALARY  | DNO |
|-------|---------|-------|---------|---------|-----|
| 2106  | 김창섭     | 대리    | 1003    | 2500000 | 2   |
| 3426  | 박영권     | 과장    | 4377    | 3000000 | 1   |
| 3011  | 이수민     | 부장    | 4377    | 4000000 | 3   |

# 3. Data Manipulation Language

## ❖ The LIMIT statement

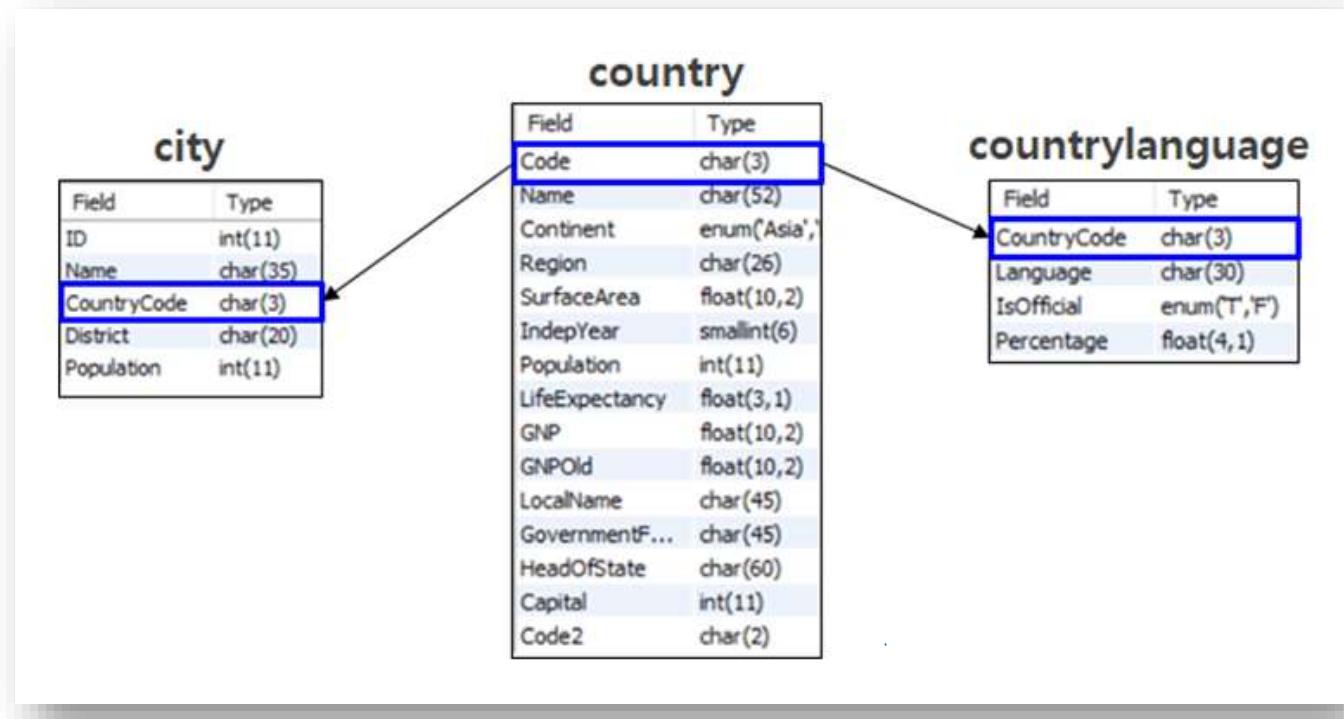

- You can also use LIMIT to show the top or the bottom tuples
- Example: Show an employee with the highest salary
  - **SELECT \***
  - **FROM** employee
  - **ORDER BY** salary DESC  
*내림차순*
  - **LIMIT 1;**

| <u>EMPNO</u> | EMPNAME | TITLE | MANAGER | SALARY  | DNO |
|--------------|---------|-------|---------|---------|-----|
| 4377         | 이성래     | 사장    | NULL    | 5000000 | 2   |

# 3. Data Manipulation Language

## ❖ Quiz 4

- Given the following WORLD database

- Find languages that are spoken in at least 3 different countries with percentage at least 50

### 3. Data Manipulation Language

- ❖ More about data

|   | CountryCode | Language   | IsOfficial | Percentage |
|---|-------------|------------|------------|------------|
| ▶ | ABW         | Dutch      | T          | 5.3        |
|   | ABW         | English    | F          | 9.5        |
|   | ABW         | Papiamento | F          | 76.7       |
|   | ABW         | Spanish    | F          | 7.4        |
|   | AFG         | Balochi    | F          | 0.9        |
|   | AFG         | Dari       | T          | 32.1       |
|   | AFG         | Pashto     | T          | 52.4       |
|   | AFG         | Turkmenian | F          | 1.9        |
|   | AFG         | Uzbek      | F          | 8.8        |

### 3. Data Manipulation Language

- ❖ Answer to Query 4: Find languages that are spoken in at least 3 different countries with percentage at least 50.

- **SELECT** Language, COUNT(CountryCode) AS N
- **FROM** CountryLanguage
- **WHERE** Percentage  $\geq 50$
- **GROUP BY** Language
- **HAVING** N  $> 2$
- **ORDER BY N DESC ;**

```
SELECT Language, COUNT(CountryCode) AS N  
FROM CountryLanguage  
WHERE Percentage  $\geq 50$   
GROUP BY Language  
HAVING N > 2  
ORDER BY N DESC;
```

|   | Language       | N  |
|---|----------------|----|
| ▶ | Spanish        | 20 |
|   | Arabic         | 16 |
|   | English        | 11 |
|   | Creole English | 8  |
|   | Creole French  | 6  |
|   | German         | 4  |
|   | Serbo-Croatian | 3  |

# 4. Summary and Discussions

## ❖ Data Definition Language (DDL)

- Notation for defining the database schema
  - Used to create and modify the structure of your relations and database objects
- Statements
  - CREATE
  - DROP
  - ALTER
  - TRUNCATE

# 4. Summary and Discussions

- ❖ MySQL constraints
  - SQL constraints are used to specify rules for the data in a relation
  - MySQL constraints
    - **NOT NULL**
    - **PRIMARY KEY**
    - **FOREIGN KEY**
    - **UNIQUE**
    - **CHECK**
    - **DEFAULT**

# **4. Summary and Discussions**

## ❖ Data Manipulation Language (DML)

- A language for searching, modifying, inserting and deleting the desired data in the database
  - DML also known as query language
- Statements
  - INSERT
  - UPDATE
  - DELETE
  - SELECT

# 4. Summary and Discussions

## ❖ The SELECT statement

- Used to select/retrieve tuples from a database

- Syntax

|                  |                                  |     |            |
|------------------|----------------------------------|-----|------------|
| <b>SELECT</b>    | [ <b>DISTINCT</b> ] attribute(s) | (1) | Compulsory |
| <b>FROM</b>      | relation(s)                      | (2) |            |
| <b>[WHERE</b>    | condition]                       | (3) |            |
| <b>[GROUP BY</b> | attribute(s)]                    | (4) | Optional   |
| <b>[HAVING</b>   | condition]                       | (5) |            |
| <b>[ORDER BY</b> | attribute(s)]                    | (6) |            |
| <b>[LIMIT</b>    | number];                         | (7) |            |
